#### 1 Question 11

The following table gives the approximate height at quarter-meter intervals of a mound of gravel. Estimate the volume of the mound by computing the average of the two Riemann sums  $S_{4,3}$  with lower-left and upper-right vertices of the subrectangles as sample points.

0.75	0.1	0.2	0.2	0.15	0.1
0.5	0.2	0.3	0.5	0.4	0.2
0.25	0.15	0.2	0.4	0.3	0.2
y: <b>0</b>	0.1	0.15	0.2	0.15	0.1
	x: <b>0</b>	0.25	0.5	0.75	1

Computing area using lower-left verticies as sample points: The verticies we will be using are:

$$\begin{bmatrix} 0.2 & 0.3 & 0.5 & 0.4 \\ 0.15 & 0.2 & 0.4 & 0.3 \\ 0.1 & 0.15 & 0.2 & 0.15 \end{bmatrix}$$

Note that  $\Delta x$  and  $\Delta y$  are both 0.25, meaning the volume of each rectangle will be the height of the rectangles times 0.25<sup>2</sup>, which is 0.0625

$$0.0625 \cdot \begin{bmatrix} 0.2 & 0.3 & 0.5 & 0.4 \\ 0.15 & 0.2 & 0.4 & 0.3 \\ 0.1 & 0.15 & 0.2 & 0.15 \end{bmatrix} = \begin{bmatrix} 0.0125 & 0.01875 & 0.03125 & 0.025 \\ 0.009375 & 0.0125 & 0.025 & 0.01875 \\ 0.00625 & 0.009375 & 0.0125 & 0.009375 \end{bmatrix}$$

Adding up these areas gives us 0.190625

Now, let's repeat, except we will use the upper-right verticies as sample points

$$0.0625 \cdot \begin{bmatrix} 0.2 & 0.2 & 0.15 & 0.1 \\ 0.3 & 0.5 & 0.4 & 0.2 \\ 0.2 & 0.4 & 0.3 & 0.2 \end{bmatrix} = \begin{bmatrix} 0.0125 & 0.0125 & 0.009375 & 0.00625 \\ 0.01875 & 0.03125 & 0.025 & 0.0125 \\ 0.0125 & 0.025 & 0.01875 & 0.03125 \end{bmatrix}$$

Adding up these areas gives us 0.196875. The average of these two sums is **0.19375**, which is our estimate for the volume of the mound.

Use symmetry to evauate the double integral

$$\iint_{\mathcal{R}} x^3 dA, \quad \mathcal{R} = [-4, 4] \times [0, 5]$$

Note that that  $x^3$  is odd and lacks horizontal or vertical shifts. This means so for some value a, the area between the curve and [-a, 0] will be equal to the area between the curve and [0, a] multiplied by -1.

Also, note that we can split the domain into two sub-domains. Let us split  $\mathcal{R}$  into  $\mathcal{R}_1 = [-4,0] \times [0,5]$  and  $\mathcal{R}_2 = [0,4] \times [0,5]$ .

$$\iint_{\mathcal{R}} x^3 dA, \quad \mathcal{R} = [-4, 4] \times [0, 5] = \iint_{\mathcal{R}_1} x^3 dA, \quad \mathcal{R}_1 = [-4, 0] \times [0, 5] + \iint_{\mathcal{R}_2} x^3 dA, \quad \mathcal{R}_2 = [0, 4] \times [0, 5]$$

From the observation we stated before, it can be said that

$$\iint_{\mathcal{R}_1} x^3 dA, \quad \mathcal{R}_1 = [-4, 0] \times [0, 5] = -\iint_{\mathcal{R}_2} x^3 dA, \quad \mathcal{R}_2 = [0, 4] \times [0, 5]$$

We can rewrite the original expression as

$$-\iint_{\mathcal{R}_2} x^3 dA + \iint_{\mathcal{R}_2} x^3 dA = 0$$

This double integral evaluates to 0.

Use symmetry to evaluate the double integral

$$\iint_{\mathcal{R}} \sin x \, dA, \quad \mathcal{R} = [0, 2\pi] \times [0, 2\pi]$$

Note that  $\sin x$  oscillates from -1 to 1. Importantly, without any transformations,  $\sin x$  completes one whole revolution from 0 to  $2\pi$ , and the function from 0 to  $\pi$  is identical to the function from  $\pi$  to  $2\pi$  reflected over the x-axis.

Also remember that we can split the domain into two sub-domains. Let us split  $\mathcal{R}$  into  $\mathcal{R}_1 = [0, \pi] \times [0, 2\pi]$  and  $\mathcal{R}_2 = [\pi, 2\pi] \times [0, 2\pi]$ .

$$\iint_{\mathcal{R}} \sin x \, dA, \quad \mathcal{R} = [0, 2\pi] \times [0, 2\pi] = \iint_{\mathcal{R}_1} \sin x \, dA, \quad \mathcal{R}_1 = [0, \pi] \times [0, 2\pi] + \iint_{\mathcal{R}_2} \sin x \, dA, \quad \mathcal{R}_2 = [\pi, 2\pi] \times [0, 2\pi]$$

From what we said before, we can observe that

$$\iint_{\mathcal{R}_1} \sin x \, dA, \quad \mathcal{R}_1 = [0, \pi] \times [0, 2\pi] = -\iint_{\mathcal{R}_2} \sin x \, dA, \quad \mathcal{R}_2 = [\pi, 2\pi] \times [0, 2\pi]$$

Finally, we can state that

$$\iint_{\mathcal{R}} \sin x \, dA, \quad \mathcal{R} = [0, 2\pi] \times [0, 2\pi] = -\iint_{\mathcal{R}_2} \sin x \, dA + \iint_{\mathcal{R}_2} \sin x \, dA = 0$$

The double integral evaluates to 0.

Evaluate the iterated integral

$$\int_{1}^{3} \int_{0}^{2} x^{3}y \, dy \, dx$$

$$\int_{1}^{3} \int_{0}^{2} x^{3}y \, dy \, dx = \int_{1}^{3} \left( \int_{0}^{2} x^{3}y \, dy \right) dx$$

$$= \int_{1}^{3} \left( x^{3} \cdot \frac{y^{2}}{2} \Big|_{y=0}^{y=2} \right) dx$$

$$= \int_{1}^{3} \left( x^{3} \cdot \left( \frac{4}{2} - \frac{0}{2} \right) \right) dx$$

$$= \int_{1}^{3} 2x^{3} \, dx = \left. \frac{x^{4}}{2} \right|_{x=1}^{x=3} = \frac{81}{2} - \frac{1}{2} = \frac{80}{2} = 40$$

The iterated integral evaluates to 40.

Evaluate the iterated integral

$$\int_{4}^{9} \int_{-3}^{8} 1 \, dx \, dy$$

$$\int_{4}^{9} \left( \int_{-3}^{8} 1 \, dx \right) dy =$$

$$\int_{4}^{9} x \Big|_{x=-3}^{x=8} dy =$$

$$\int_{4}^{9} 11 \, dy = 11x \Big|_{x=4}^{x=9} = 99 - 44 = 55$$

The iterated integral evaluates to 55.

Evaluate the iterated integral

$$\int_{-1}^{1} \int_{0}^{\pi} x^{2} \sin y \, dy \, dx$$

$$\int_{-1}^{1} \left( \int_{0}^{\pi} x^{2} \sin y \, dy \right) dx$$

$$\int_{-1}^{1} \left( x^{2} \cdot -\cos y \Big|_{y=0}^{y=\pi} \right) dx$$

$$\int_{-1}^{1} x^{2} (1 - (-1)) \, dx$$

$$\int_{-1}^{1} 2x^{2} \, dx = \frac{2x^{3}}{3} \Big|_{x=-1}^{x=1} = \frac{2}{3} - \frac{-2}{3} = \frac{4}{3}$$

The iterated integral evaluates to  $\frac{4}{3}$ .

Evaluate the iterated integral

$$\int_{2}^{6} \int_{1}^{4} x^{2} dx dy$$

$$\int_{2}^{6} \left( \int_{1}^{4} x^{2} dx \right) dy$$

$$\int_{2}^{6} \left( \frac{x^{3}}{3} \Big|_{x=1}^{x=4} \right) dy$$

$$\int_{2}^{6} \frac{64}{3} - \frac{1}{3} dy = \int_{2}^{6} \frac{63}{3} dy$$

$$\frac{63x}{3} \Big|_{x=2}^{x=6} = \frac{378 - 126}{3} = \frac{252}{3} = 84$$

The iterated integral evaluates to 84.

Evaluate the integral

$$\iint_{\mathcal{R}} \frac{x}{y} dA, \quad \mathcal{R} = [-2, 4] \times [1, 3]$$

$$\iint_{\mathcal{R}} \frac{x}{y} dx dy, \quad \mathcal{R} = [-2, 4] \times [1, 3]$$

$$\int_{1}^{3} \int_{-2}^{4} \frac{x}{y} dx dy$$

$$\int_{1}^{3} \left(\frac{x^{2}}{2y}\Big|_{x=-2}^{x=4} dx\right) dy$$

$$\int_{1}^{3} \frac{1}{2y} (16 - 4) dy$$

$$\int_{1}^{3} \frac{6}{y} dy$$

$$6 \ln y \Big|_{y=1}^{y=3} = 6 \ln 3 - 6 \ln 1 = 6 \ln 3$$

Evaluate the integral

$$\iint_{\mathcal{R}} \frac{y}{x+1} dA, \quad \mathcal{R} = [0,2] \times [0,4]$$

$$\int_{0}^{4} \int_{0}^{2} \frac{y}{x+1} dx dy$$

$$\int_{0}^{4} \int_{0}^{2} \frac{y}{x+1} dx dy$$

$$\int_{0}^{4} \left( y \ln|x+1| \Big|_{x=0}^{x=2} \right) dy$$

$$\int_{0}^{4} y (\ln|3| - \ln|1|) dy$$

$$\int_{0}^{4} y \ln|3| d$$

$$\frac{\ln|3| y^{2}}{2} \Big|_{y=0}^{y=4}$$

$$8 \ln 3$$

The solution to this evaluated integral is  $8\ln 3$ 

Let  $f(x,y) = mxy^2$ , where m is a constant. Find a value of m such that  $\iint_{\mathcal{R}} f(x,y) \, dA = 1$ , where  $\mathcal{R} = [0,1] \times [0,2]$ 

$$\int_0^2 \int_0^1 mxy^2 dx dy$$

$$\int_0^2 \left( \frac{mx^2y^2}{2} \Big|_{x=0}^{x=1} \right) dy$$

$$\int_0^2 \frac{my^2}{2} dy$$

$$\frac{my^2}{2} \Big|_{y=0}^{y=2}$$

$$2m = 1$$

$$m = \frac{1}{2}$$

When  $m=\frac{1}{2},$  the expression  $\iint_{\mathcal{R}} f(x,y) \, dA, \mathcal{R}=[0,1] \times [0,2]=1$  is true!

- a) Which is easier, antidifferentiating  $xe^{xy}$  with respect to x or with respect to y? Explain.
- b) Evaluate  $\iint_{\mathcal{R}} xe^{xy} dA$ , where  $\mathcal{R} = [0,1] \times [0,1]$ a) It is easier antidifferentiating  $xe^{xy}$  with respect to y, as we can simply treat x as a constant. Computing  $\int xe^{xy} dy$  requires the same steps as solving  $\int 4e^{4y} dy$ , which is relatively simple

$$\iint_{\mathcal{R}} xe^{xy} dA, \mathcal{R} = [0, 1] \times [0, 1]$$

$$\int_{0}^{1} \int_{0}^{1} xe^{yx} dy dx$$

$$\int_{0}^{1} \left( e^{yx} \Big|_{y=0}^{y=1} \right) dx$$

$$\int_{0}^{1} e^{x} - 1 dx$$

$$e^{x} - x \Big|_{x=0}^{x=1}$$

$$e - 1 - 1 - 0 = e - 2$$

The integral evaluates to e-2

- a) Which is easier, antidifferentiating  $\frac{y}{1+xy}$  with respect to x or with respect to y? Explain. b) Evaluate  $\iint_{\mathcal{R}} \frac{y}{1+xy} dA$ , where  $\mathcal{R} = [0,1] \times [0,1]$
